ABSTRACT OF THE DISCLOSURE

A data processing system comprises at least a client, a control process unit and a customization unit. The control process unit is configured to execute a control process that enables access to the system from the client. The control process is based on a decision-tree. The decision-tree is comprised of inter-linked decision nodes. The customization unit is coupled to the control process unit. The customization unit determines from user-information a user entry decision-node and the customization unit configures the control process to enable the user to access the system from the client at the user entry decision-node.
